t (size of the frozen orbit μ_t)
the value itself (Thm 3.1)
criterion, no external input (Cor 8.22)
criterion, modulo one input (Thm 8.6)
one implication proved (Thm 8.35);
converse conjectural (Conj 8.43)
columns of odd t are settled outright;
the row $r = 1$ is the only place the value,
and not merely its vanishing, is known
