

(a) $\lambda = (5, 3, 2, 1, 1, 0)$

(b) $\beta_j = \lambda_j + N - j$, strictly decreasing

(c) the classes mod $t = 4$, and the excess

$$\sum_i (n_i - 1) = 2 = 2r, \text{ so } r = 1$$

the dashed classes are the excess $\mathcal{E}$; $|\mathcal{E}| = e = 2$
